# TOPIC OUTLINE

Point Estimate

Confidence Interval

z-Distribution

# POINT ESTIMATE

# POINT ESTIMATE

---

A point estimate is a single value (statistic) derived from sample data that serves as the "best guess" for an unknown population parameter.

$\bar{x}$  is a point estimate  $\mu$ .

$s^2$  is a point estimate  $\sigma^2$ .

## Example

A factory produces resistors labeled as **100  $\Omega$** , but due to manufacturing variations, the actual resistance varies. An engineer takes a random samples of 30 resistors and calculated the average resistance of the sample,  $\bar{x} = \mathbf{101.2 \Omega}$ .

The point estimate for the true mean resistance  $\mu$  of all resistors produced is **101.2  $\Omega$** .

# CONFIDENCE INTERVAL

# CONFIDENCE INTERVAL

A confidence interval is a range of values, derived from sample data, that is likely to contain the true value of an unknown population parameter (e.g.,  $\mu$ ,  $\sigma^2$ ).

## Example

A factory produces resistors labeled as **100  $\Omega$** , but due to manufacturing variations, the actual resistance varies. An engineer takes a random samples of 30 resistors and calculated a 95% confidence interval for the true mean resistance, **95% CI = [99.41  $\Omega$ , 102.99  $\Omega$ ]**

# CONFIDENCE INTERVAL

A confidence interval is a range of values, derived from sample data, that is likely to contain the true value of an unknown population parameter (e.g.,  $\mu$ ,  $\sigma^2$ ).

## Example

We are 95% confident that the true mean  $\mu$  of all resistors produced lies between 99.41  $\Omega$  and 102.99  $\Omega$ .

# CONFIDENCE LEVEL

Confidence levels (e.g., 90%, 95%, 99%)

describe the method's reliability over many samples.

A 95% confidence level means that if the same sampling process were **repeated** many times, approximately 95% of the calculated CIs would contain the true population parameter (e.g.,  $\mu, \sigma^2$ ).

Example

# CONFIDENCE LEVEL

Confidence levels (e.g., 90%, 95%, 99%)

describe the method's reliability over many samples.

Formula:

$$\text{confidence level} = 1 - \alpha$$

where:

$$0 \leq \alpha \leq 1$$

95% Confidence Level

# CONFIDENCE LEVEL

Confidence levels (e.g., 90%, 95%, 99%)

describe the method's reliability over many samples.

Formula:

$$\text{confidence level} = 1 - \alpha$$

where:

$$0 \leq \alpha \leq 1$$

99% Confidence Level

$$\alpha = 0.01$$

# CONFIDENCE LEVEL

Confidence levels (e.g., 90%, 95%, 99%)

describe the method's reliability over many samples.

Formula:

$$\text{confidence level} = 1 - \alpha$$

where:

$$0 \leq \alpha \leq 1$$

100% Confidence Level

# Z-DISTRIBUTION

# Z-DISTRIBUTION

The z-distribution is used to calculate the confidence interval when:

1. The population variance ( $\sigma^2$ ) is known.
2. The sample size is large ( $n \geq 30$ ).

Formula:

$$CI = \bar{x} \pm z_{\alpha/2} \left( \frac{\sigma}{\sqrt{n}} \right)$$

where:

$\bar{x}$  = sample mean

$z_{\alpha/2}$  = z-statistic

$\frac{\sigma}{\sqrt{n}}$  = standard error

# Z-DISTRIBUTION

The z-distribution is used to calculate the confidence interval when:

1. The population variance ( $\sigma^2$ ) is known.
2. The sample size is large ( $n \geq 30$ ).

Formula:

$$CI = \bar{x} \pm z_{\alpha/2} \left( \frac{\sigma}{\sqrt{n}} \right)$$

where:

$\bar{x}$  = sample mean

$z_{\alpha/2}$  = z-statistic

$\frac{\sigma}{\sqrt{n}}$  = standard error

## Percent Point Function

`norm.ppf()` returns the critical **z** value for a given probability (1-alpha).

### Two-tailed test

`z_critical = stats.norm.ppf(1-alpha/2)`

### One-tailed test

`z_critical = stats.norm.ppf(1-alpha)`

# Z-DISTRIBUTION

The z-distribution is used to calculate the confidence interval when:

1. The population variance ( $\sigma^2$ ) is known.
2. The sample size is large ( $n \geq 30$ ).

Formula:

$$CI = \bar{x} \pm z_{\alpha/2} \left( \frac{\sigma}{\sqrt{n}} \right)$$

where:

$\bar{x}$  = sample mean

$z_{\alpha/2}$  = z-statistic

$\frac{\sigma}{\sqrt{n}}$  = standard error

## Interval Function

`norm.interval()` returns a tuple (lower\_limit, upper\_limit) representing the confidence interval for z-interval.

### Syntax

```
ci_lower, ci_upper =  
stats.norm.interval(  
    confidence = confidence_level,  
    loc = sample_mean,  
    scale = standard_error  
)
```

## EXERCISE

---

A power company measures the voltage output (in volts) of a batch of transformers. The population standard deviation ( $\sigma$ ) is known to be **0.5** volts. A random sample of **30** transformers is tested, and their voltage outputs are recorded in "transformer-voltage-data" dataset . Calculate a **95% confidence interval** for the true mean voltage output ( $\mu$ ) of all transformers.

Solution
