Electronics Engineer

TOPIC OUTLINE

1 Proportion Test

2 Proportion Test

ANOM

1 PROPORTION TEST

1 PROPORTION TEST

A 1 Proportion Test tests whether the proportion of successes in a single sample differs from a hypothesized population proportion.

Null Hypothesis

$$H_0: P_1 = P_0$$

Alternative Hypothesis

$$H_a: P_1 \neq P_0$$

Binomial Test

```
binomtest(  
    k = number of success,  
    n = total number of trials,  
    p = population proportion  
)
```

Z-Test

```
z_stat, p_value = proportions_ztest(  
    count = number of success,  
    nobs = total number of trials,  
    value = population proportion  
)
```

EXERCISE

In a survey of **1250** people, **600** preferred product A.
Test if this is significantly **different** from the expected
50% preference.

Solution

Null Hypothesis

$$H_o: P_1 = 0.5$$

Alternative Hypothesis

$$H_a: P_1 \neq 0.5$$

2 PROPORTION TEST

2 PROPORTION TEST

A 2 Proportion Test compares proportions between two independent groups.

Null Hypothesis

$$H_0: P_1 = P_2$$

Alternative Hypothesis

$$H_a: P_1 \neq P_2$$

Z-Test

```
z_stat, p_value = proportions_ztest(  
    count = [success_1, success_2],  
    nobs = [trial_1, trial_2],  
)
```

EXERCISE

A company produces two types of circuit boards, Board A and Board B. In a quality test:

- 35 out of 150 Board A samples were defective
- 25 out of 120 Board B samples were defective

Is there a significant difference in the defect rates between Board A and Board B at a 5% significance level?

Solution

Null Hypothesis

$$H_0: \text{Board A} = \text{Board B}$$

Alternative Hypothesis

$$H_a: \text{Board A} \neq \text{Board B}$$

ANOM

ANOM

Analysis of Means (ANOM) is multiple comparison method to determine which group proportions (or means) differ from the overall average.

Null Hypothesis

$$H_0: P_1 = P_2 = P_3$$

Alternative Hypothesis

$$H_a: \text{at least 1 } \neq$$

Chi-square Test for Proportions

```
chi_stat, p_value, table =  
proportions_chisquare(  
    counts = [success array],  
    nobs = [trials array],  
)
```

EXERCISE

A company produces two types of circuit boards, Board A and Board B. In a quality test:

- 35 out of 150 Board A samples were defective
- 25 out of 120 Board B samples were defective
- 30 out 85 Board C samples were defective

Is there a significant difference in the defect rates between the boards at a 5% significance level?

Solution

Null Hypothesis

H_0 : Board A = Board B = Board C

Alternative Hypothesis

H_a : at least 1 board is different
