**Measures of Variability** 

Range and Interquartile Range

**Variance and Standard Deviation** 

**Coefficient of Variation** 

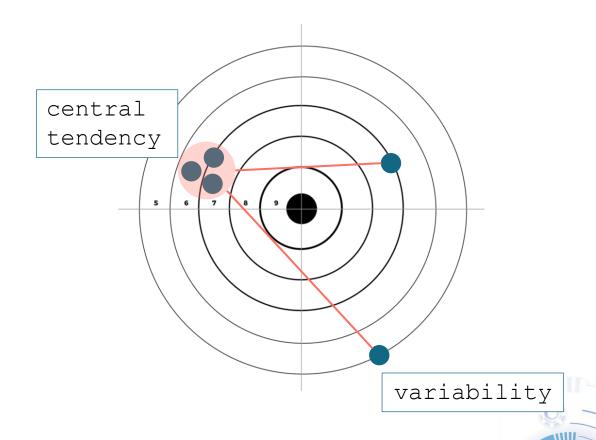

# MEASURES OF VARIABILITY

#### **MEASURES OF VARIABILITY**

Measures of variability (or dispersion) describe how spread out or scattered a dataset is. These measures provide insights into the consistency of data points relative to the central tendency (mean, median, or mode).

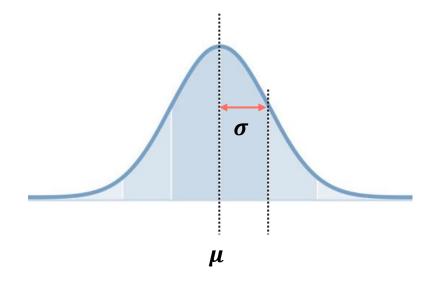

#### **Dartboard Analogy:**

#### **MEASURES OF VARIABILITY**

Measures of variability (or dispersion) describe how spread out or scattered a dataset is. These measures provide insights into the consistency of data points relative to the central tendency (mean, median, or mode).

#### Normal Distribution:

# RANGE AND INTERQUARTILE RANGE

## **RANGE**

#### **Boxplot:**

0

The <u>range</u> is the simplest measure of variability and is calculated as the <u>difference</u> between the maximum and minimum values in a dataset.

#### Formula:

 $range = maximum \ value - minimum \ value$ 

0

# INTERQUARTILE RANGE

**Boxplot:** 

The <u>interquartile range (IQR)</u> measures the spread of the middle 50% of the data, reducing the influence of outliers.

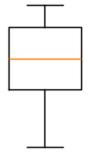

#### Formula:

$$IQR = Q_3 - Q_1$$

where:

 $Q_1$ (first quartile) is the median of the lower half of the data (25%).

 $Q_3$ (third quartile) is the median of the upper half of the data (75%).

0

0

The dataset provided contains the exam grades of 12 students. Calculate the <u>range</u> and <u>interquartile range</u> (IQR) to analyze the spread and variability of the grades.

#### Exam Performance

| Student | Grade |  |  |
|---------|-------|--|--|
| 1       | 3.5   |  |  |
| 2       | 6.7   |  |  |
| 3       | 7     |  |  |
| 4       | 7.4   |  |  |
| 5       | 7.8   |  |  |
| 6       | 8.2   |  |  |
| 7       | 8.5   |  |  |
| 8       | 8.8   |  |  |
| 9       | 9     |  |  |
| 10      | 9.1   |  |  |
| 11      | 9.4   |  |  |
| 12      | 9.8   |  |  |

# VARIANCE AND STANDARD DEVIATION

### **VARIANCE**

#### **Population Variance:**

$$\sigma^2 = \frac{\sum_{i=1}^N (x_i - \mu)^2}{N}$$

Variance measures the average squareddeviation of each data point from the mean.

## Sample Variance:

$$s^{2} = \frac{\sum_{i=1}^{N} (x_{i} - \overline{x})^{2}}{n-1}$$

# STANDARD DEVIATION

#### **Population Variance:**

$$\sigma = \sqrt{\sigma^2}$$

The **standard deviation** is the **square root** of variance.

### Sample Variance:

$$s = \sqrt{s^2}$$

The dataset provided contains the sugar content (in grams) per serving for 10 popular breakfast cereals. Calculate the <u>variance</u> and <u>standard</u> <u>deviation</u> to measure the spread or variability in the sugar content across these cereals.

#### Breakfast Cereal

| Brand | Sugar |  |  |
|-------|-------|--|--|
| A     | 12    |  |  |
| В     | 9     |  |  |
| С     | 15    |  |  |
| D     | 8     |  |  |
| E     | 10    |  |  |
| F     | 11    |  |  |
| G     | 13    |  |  |
| H     | 7     |  |  |
| I     | 14    |  |  |
| J     | 6     |  |  |

# POOLED STANDARD DEVIATION

Pooled standard deviation is a weighted average of the standard deviations from two or more groups.

Formula:

$$\overline{\sigma}_{pooled} = \sqrt{\overline{\sigma^2}}$$

where:

$$\overline{\sigma^2} = \frac{\sum_{i=1}^n \sigma_i^2}{n}$$

#### Variances add:

$$\sigma_{total}^2 = \sigma_1^2 + \sigma_2^2 + \cdots \sigma_n^2$$

#### Standard deviations do not:

$$\sigma_{total} \neq \sigma_1 + \sigma_2 + \cdots \sigma_n$$

The dataset provided contains the battery life (in hours) for smartphones from different models. Calculate the **pooled standard deviation** to measure the combined variability in battery life across these models.

#### Battery Life

| Model | Hours |
|-------|-------|
| A     | 12.5  |
| Α     | 12.8  |
| A     | 12.7  |
| A     | 13.3  |
| Α     | 12.6  |
| В     | 13.5  |
| В     | 14.1  |
| В     | 13.9  |
| В     | 14.3  |
| В     | 13.7  |
| С     | 11.8  |
| С     | 11.9  |
| С     | 12.1  |
| С     | 12.2  |
| С     | 11.6  |

# COEFFICIENT OF VARIATION

## **COEFFICIENT OF VARIATION**

#### Population Coefficient of Variation:

$$c_v = \frac{\sigma}{\mu}$$

Coefficient of variation  $(c_v)$  is a relative measure of variability, expressed as the ratio of the standard deviation to the mean.

#### Sample Coefficient of Variation:

$$\widehat{c_v} = \frac{\sigma}{\overline{x}}$$

The provided dataset includes ice cream prices listed in both USD and PHP. Calculate the **standard deviation** and **coefficient of variation** for each currency to analyze the variability in prices.

Ice Cream Price List

| Ice Cream | Price | (USD) | Price | (PHP) |
|-----------|-------|-------|-------|-------|
| Brand A   | 3.5   |       | 203   |       |
| Brand B   | 4     |       | 232   |       |
| Brand C   |       |       | 217.5 |       |
| Brand D   | 4.25  |       | 246.5 |       |
| Brand E   |       |       | 226.2 |       |
| Brand F   | 4.1   |       | 237.8 |       |
| Brand G   | 3.6   |       | 208.8 |       |
| Brand H   | 4.5   |       | 261   |       |
| Brand I   | 3.8   |       | 220.4 |       |
| Brand J   | 4.15  |       | 240.7 |       |

# **LABORATORY**
